Gulf of Mexico Harmful Algal Bloom Bulletin

Region: Texas

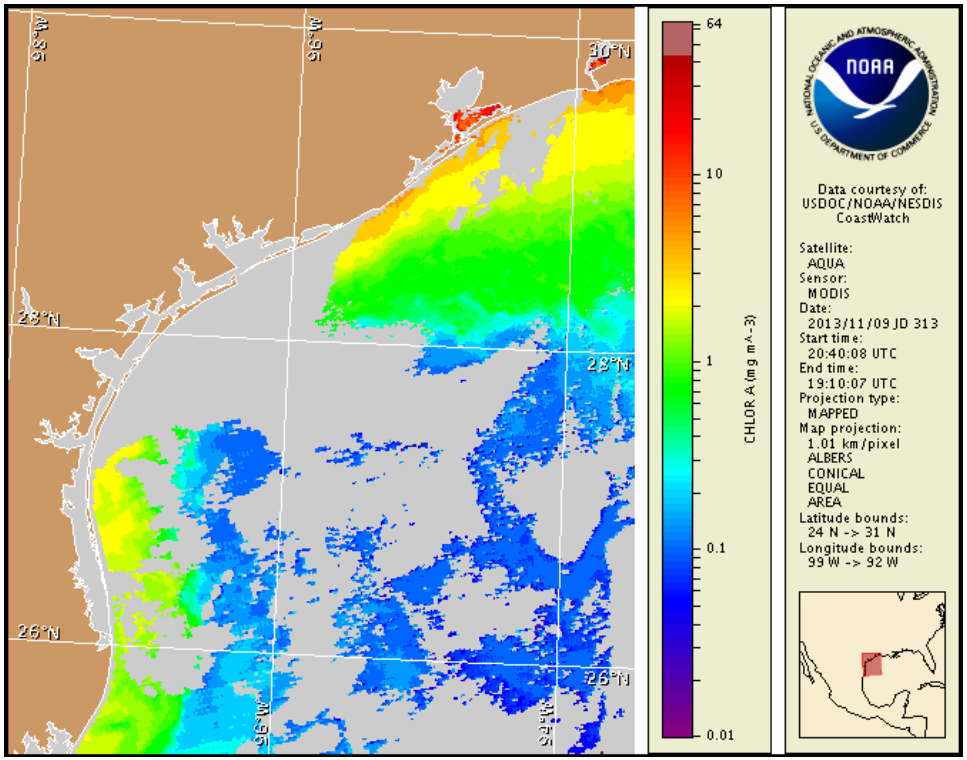
Tuesday, 12 November 2013

NOAA National Ocean Service

NOAA Satellite and Information Service

NOAA National Weather Service

Last bulletin: Monday, November 4, 2013



Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s), when applicable. Points represent cell concentration sampling data from November 2 to 8: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Detailed sample information can be obtained through the Texas Parks and Wildlife Department at:

Conditions Report

There is currently no indication of *Karenia brevis* (commonly known as Texas red tide) along the coast of Texas. No respiratory irritation is expected Tuesday, November 12 through Monday, November 18. Check http://tidesandcurrents.noaa.gov/hab/beach_conditions.html for recent, local observations.

There are currently patches of a bloom of the algae *Aureoumbra lagunensis* in the upper Laguna Madre region. This algae species does not produce the respiratory irritation associated with the Texas red tide caused by *Karenia brevis*, but it may cause discolored water and fish kills.

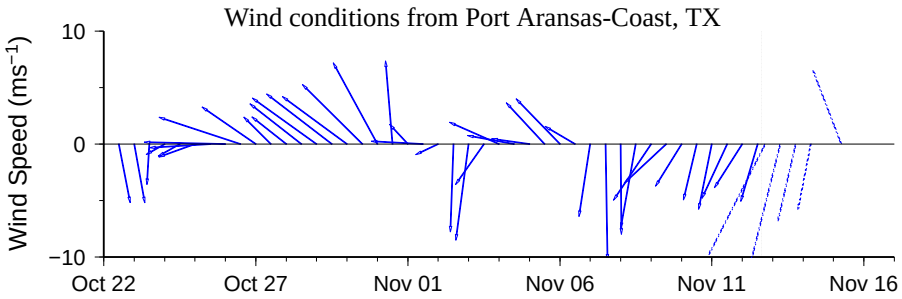
Analysis

There is currently no indication of *Karenia brevis* along the coast of Texas. For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Recent MODIS Aqua imagery is obscured by clouds, limiting analysis. In MODIS imagery from 11/9 (shown left), patches of elevated chlorophyll (1-3μg/L) are visible stretching along- and offshore from the Bolivar Peninsula to East Matagorda Bay, as well as offshore Padre Island to the Rio Grande. Elevated chlorophyll is most likely not indicative of the presence of *K. brevis* and is probably due to the resuspension of benthic chlorophyll and sediments along the coast.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of 200 km south from the Port Aransas region from November 9-15.

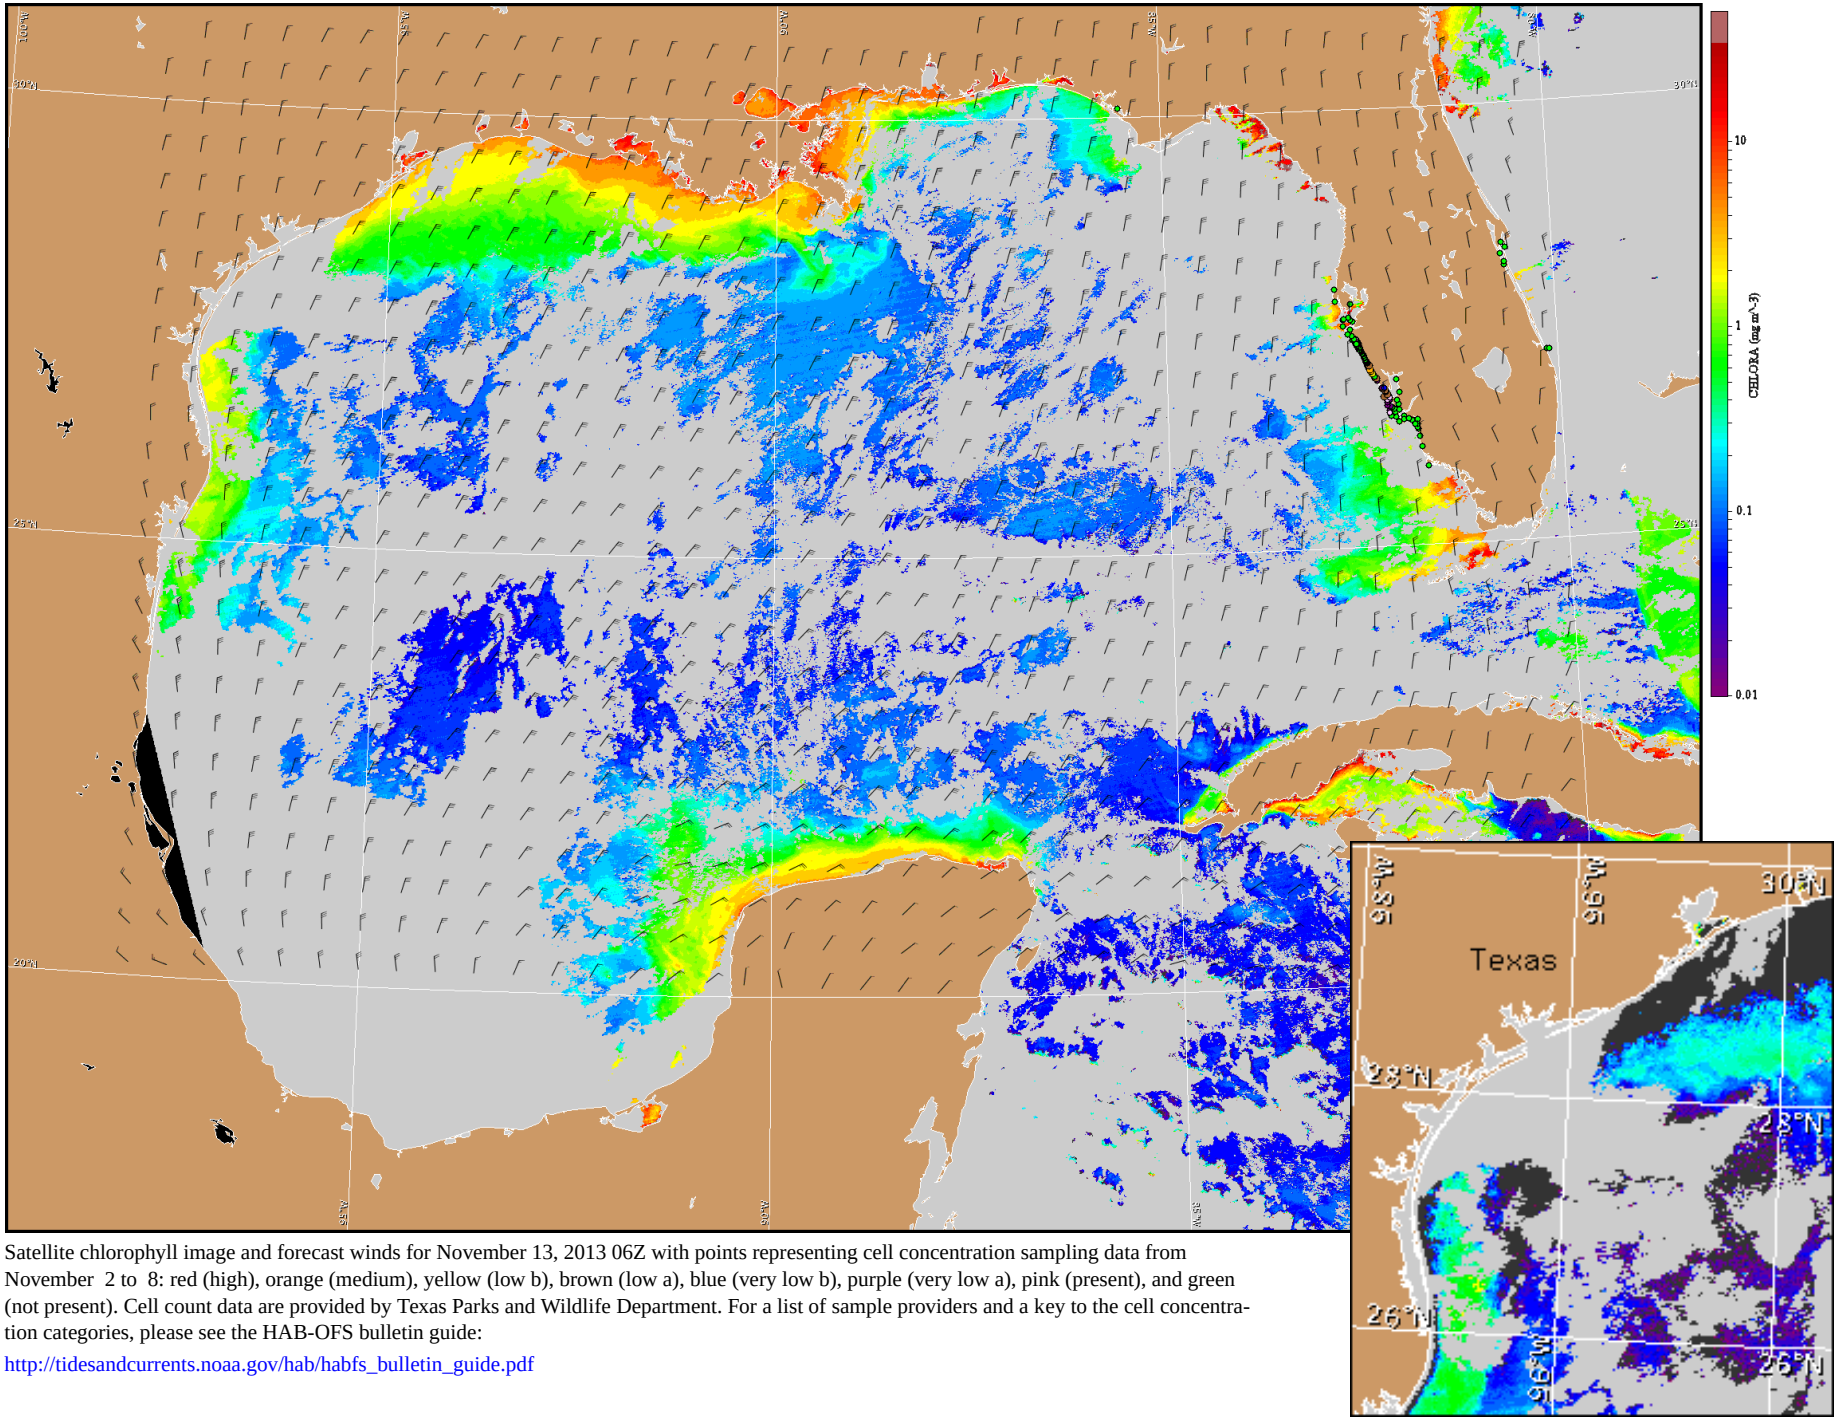
Derner, Davis



Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Wind Analysis

Port Aransas: North winds (15-30kn, 8-15m/s) today and tonight, with gusts up to 40kn (20m/s). North winds (15-25kn, 8-13m/s) Wednesday becoming northeast winds (10-15kn, 5-8m/s) Wednesday night. Northeast winds (5-10kn, 3-5m/s) Thursday becoming southeast (10-15kn) Thursday afternoon through night. South to southeast winds (5-15kn, 3-8m/s) Friday shifting east (5-15kn) in the afternoon through Friday night. Southeast winds (5-10kn) Saturday.



Satellite chlorophyll image and forecast winds for November 13, 2013 06Z with points representing cell concentration sampling data from November 2 to 8: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
